Tests

Insert lip hook to female white socket (1). Insert measuring wire plug into base socket. Insert USB measuring cable's large male plug into base USB's socket (2). Insert USB measuring cable's small male plug into handpiece socket (3).

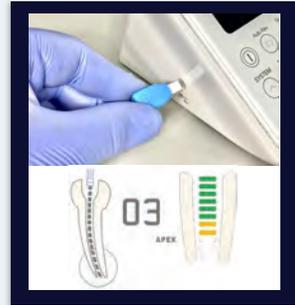

Place rubber dam isolation prior to endodontic treatment. Place the lip hook onto patient's lip.

Select the file system to be used by touching SYSTEM up or down (1). Select **Genius Proflex Rotary** (2).

C.S. (Curvature Sweetener, 1) is the first file to be set up to temporary W.L. Preflare the canal. Use copious irrigation.

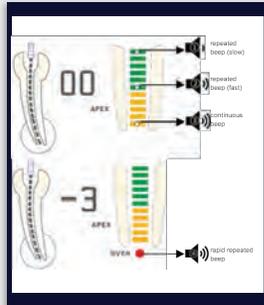

Pull out measuring wire and turn base off by touching power for 3 seconds. Insert tester on the same slot of measurement wire. Turn base on. Display will show 01, 02, 03, or 04.

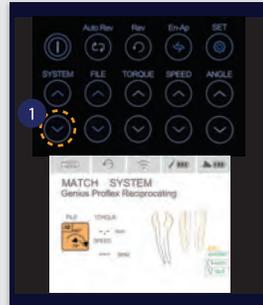

All results means working properly.

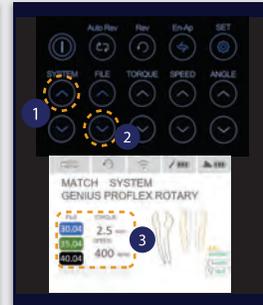

Ensure lip hook is in position. Connect file clip to the gray female socket. Place a K-File of proper diameter inside canal up to temporary W.L. Connect file clip to file. File icon inside tooth canal image (1) will appear.

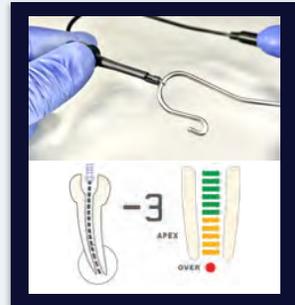

Advance file. As instrument progresses toward foramen, color instruction bars accompanied by audio signals will indicate file's progress. Stop file apical movement when the instructions bars reach "00" [foramen exit position].

Disconnect file clip. Leave lip hook in position. Touch system down (1) to select **Genius Proflex Reciprocating**. Place Genius Proflex 25 .04 in contra-angle. Insert 25 .04 file inside canal. As file approaches W.L., display will show file progress.

Touch SYSTEM (1) up back to Genius Proflex Rotary. Touch FILE down (2) and select 30.04/35.04/40.04 (3). Place Genius Proflex 35.04 in contra-angle. Insert 35.04 file inside canal. As file approaches the working length, display will show file progress.

Grab the lip hook with the bent wire of the file clip.

All instruction bars will be displayed alongside a "-3" and a repeated beep sound alarm.
